

High performance ground contact structural deck joists.

Tru-Joist
by claymark

Tru-Joist by Claymark is a high-performance primed structural deck joist engineered specifically for ground contact applications, making it an ideal choice for low-level deck construction. Manufactured from finger-jointed clear New Zealand Radiata pine and treated with advanced H4 MicroPro® technology, Tru-Joist delivers the structural strength, durability and long-term reliability required for demanding outdoor environments.

The factory-applied primer & undercoat also provides a consistent finish, helping to protect the timber prior to coating while supporting a cleaner, more efficient installation.

Designed specifically for Australian conditions, Tru-Joist is backed by a 50-year warranty against termite attack and fungal decay, giving homeowners and builders confidence in its long-term performance. Its H4 treatment makes it well suited to applications where the timber is exposed to moisture or close to the ground, helping to reduce the risk of premature deterioration.

Combining proven durability, structural integrity and dependable protection, Tru-Joist is the ultimate deck joist solution for creating strong, long-lasting low-level decks. The perfect solution for all your project needs.
